			1634	
SHORTENED STATUTORY PERIOD OF RESPONSE		NOTIFICATION DATE	DELIVERY MODE	
3 MONTHS		04/27/2007	ELECTRONIC	

Please find below and/or attached an Office communication concerning this application or proceeding.

If NO period for reply is specified above, the maximum statutory period will apply and will expire 6 MONTHS from the mailing date of this communication.

Notice of this Office communication was sent electronically on the above-indicated "Notification Date" and has a shortened statutory period for reply of 3 MONTHS from 04/27/2007.

Notice of the Office communication was sent electronically on above-indicated "Notification Date" to the following e-mail address(es):

jcartee@kmob.com
eOAPilot@kmob.com

Office Action Summary	Application No. 10/035,822	Applicant(s) REMACLE ET AL.	
	Examiner Bradley L. Sisson	Art Unit 1634	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 20 February 2007.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-45, 50, 52-54, 60-66, 69-75, 78 and 81-92 is/are pending in the application.
- 4a) Of the above claim(s) 1-44 and 85 is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 45, 50, 52-54, 60-66, 69-75, 78, 81-84 and 86-92 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☒ Certified copies of the priority documents have been received in Application No. 09/582,817.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Election/Restrictions

1. Claims 1-44 remain withdrawn from further consideration pursuant to 37 CFR 1.142(b) as being drawn to a nonelected invention, there being no allowable generic or linking claim.

Election was made **without** traverse in the reply filed on 23 September 2003.

2. The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the “right to exclude” granted by a patent and to prevent possible harassment by multiple assignees. A nonstatutory obviousness-type double patenting rejection is appropriate where the conflicting claims are not identical, but at least one examined application claim is not patentably distinct from the reference claim(s) because the examined application claim is either anticipated by, or would have been obvious over, the reference claim(s). See, e.g., *In re Berg*, 140 F.3d 1428, 46 USPQ2d 1226 (Fed. Cir. 1998); *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

3. A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) or 1.321(d) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent either is shown to be commonly owned

Art Unit: 1634

with this application, or claims an invention made as a result of activities undertaken within the scope of a joint research agreement.

4. Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR

3.73(b).

5. Claims 1-45, 50, 52-54, 60-66, 69-75, 78, and 81-92 are provisionally rejected on the ground of nonstatutory obviousness-type double patenting as being unpatentable over claims 30, 32-34, 40, 41, 45, 49, and 51-64 of copending Application No. 09/582,817. Although the conflicting claims are not identical, they are not patentably distinct from each other because the claims of the '817 application fairly teach the claimed methods, disc, kit, and detection device.

6. This is a provisional obviousness-type double patenting rejection because the conflicting claims have not in fact been patented.

Claim Rejections - 35 USC § 112

7. The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

8. Claims 45, 50, 52-54, 60-66, 69-75, 78, 81-84, and 86-92 are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim(s) contains subject matter, which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention. Attention is directed to the

Art Unit: 1634

decision in *University of Rochester v. G.D. Searle & Co.* 68 USPQ2D 1424 (Fed. Cir. 2004) at 1428:

To satisfy the written-description requirement, the specification must describe every element of the claimed invention in sufficient detail so that one of ordinary skill in the art would recognize that the inventor possessed the claimed invention at the time of filing. *Vas-Cath*, 935 F.3d at 1563; see also *Lockwood v. American Airlines, Inc.*, 107 F.3d 1565, 1572 [41 USPQ2d 1961] (Fed. Cir. 1997) (patent specification must describe an invention and do so in sufficient detail that one skilled in the art can clearly conclude that “the inventor invented the claimed invention”); *In re Gosteli*, 872 F.2d 1008, 1012 [10 USPQ2d 1614] (Fed. Cir. 1989) (“the description must clearly allow persons of ordinary skill in the art to recognize that [the inventor] invented what is claimed”). Thus, an applicant complies with the written-description requirement “by describing the invention, with all its claimed limitations, not that which makes it obvious,” and by using “such descriptive means as words, structures, figures, diagrams, formulas, etc., that set forth the claimed invention.” *Lockwood*, 107 F.3d at 1572.

9. Claims 45, 50, 52-54, 60-66, 69-75, 78, 81-84, and 86-92 are drawn to the following inventions:

- Claims 45, 50, 52-54, 60-66, 69, and 89-92 are drawn to a disc comprising registered data
- Claims 70-72 and 87 are drawn to a method of making a disc;
- Claims 73, 86, and 88 are drawn to a kit;
- Claims 74, 75, and 78 are drawn to a detection and/or reading device; and
- Claims 81-84 are drawn to a handling device for a disc.

10. A review of the disclosure finds the following examples:

Examples

Example 1: Detection of DNA on CD

Example 2: Detection of DNA on CD with laser detection

Example 3: Detection of protein on CD by light absorption

Example 4: Detection of protein Chips on CD with colorimetric labeling

Example 5: Detection of auto-immune antibodies on CD

Example 6: Magnetic detection of DNA or protein on CD

Example 7: Detection of several bacterial species and their genus by DNA microarrays present on the CDs

Bio-CD™ spotting

Example 8: Detection of gene expression on microarrays present on the CDs: example of HepatoChips

HepatoChips Design: Fifty-nine genes microarray

Example 9: Multiple sample analysis in the different molded chambers present on the same disc platform.

Example 10: Steps performed by the automate in the hybridization chamber.

Example 11: Olefinic oxidation

Example 12: Steps performed by the automate in the extraction, dilution, amplification and hybridization chamber.

Example 13: Target detection trough the reflective layer of a CD with one laser illumination beam and two detectors

Example 14: Description of a fluorescent reading device

Example 15: Detection of protein upon the disc according to the invention with colorimetric labeling

Example 16 : Detection of auto-immune antibodies upon the disc according to the invention

11. The claimed invention has been amended so to require the presence of at least single stranded nucleic acids that are to serve as capture molecules, and that the CD or DVD comprises binary information that is to be read at the same time the hybridization results are. None of the

Art Unit: 1634

examples provided disclose such a CD or DVD, much less a method of performing both aspects of the method. Similarly, none of the examples provide an adequate written description of any device capable of making such a CD or DVD or reading it, or capable of carrying out all phases of any related assay. Additionally, the examples provided fail to provide an adequate written description of the full genus of discs claimed. Furthermore, it is noted that none of the “capture molecules” are impervious to any and all forms of cleavage, an embodiment encompassed by the claims.

12. The specification also does not provide an adequate written description of those nucleic acids that are useful such that one of skill in the art would be able to recognize those embodiments that are useful from those that are not.

13. While Example 8 teaches of using the “Rat HepatoChipsTM (AAT, Namur, Belgium),” and page 61 describes the nucleic acids as being “single stranded DNA probes attached to the glass by a covalent link,” and Table 2 defines the target molecule in terms of certain genes and how they are believed to function, such does not provide an adequate written description of the immobilized nucleic acids, as such again speaks to functional attributes, and not physical or chemical properties that would allow a skilled artisan to recognize one sequence as being encompassed, or not encompassed, by the claims. Further, the record does not support the position that applicant possessed the nucleotide sequence for any and all target molecules, which fairly encompass any nucleic acid sequence that correlates with intelligence, aging, as well as correlating with any disease of any etiology, for any and all life forms.

14. It is noted that claim 45, 50, 52-54, 60-66, 69, and 89-92 have no upper or lower limit on density of the “specific surface area” of the disc to which the capture molecules are bound. A

Art Unit: 1634

review of the disclosure fails to find where the full scope of the claims has been adequately described so as to reasonably suggest that applicant was in possession of the invention at the time of filing. Furthermore, the specification has not been found to provide an adequate written description of even one disc, be it a CD or DVD, which has the minimum number of arrays and the minimum density of said arrays, wherein said disc also has binary information and can be read subsequent to any hybridization reaction and wherein said reading is to be performed by the same device.

15. As presently worded, said claims fairly encompass DNA and registered data being found on both sides of the disc. While claim 54 does specify that capture molecules are on one side and registered data is found on the other, such does not necessarily exclude both from appearing on both sides, or where the capture molecule is a nucleic acid and the nucleic acid can serve as both computer-readable information storage device and as a capture means. Support for this interpretation of the claims is based in part upon the amendment of claim 65, which states that “the nucleic acid capture molecules correspond to data bytes.” (Emphasis added.) Recognizing the interest in the art to develop a DNA-computer, and with the claims encompassing computer-readable media (e.g., CDs and DVDs), and the explicit statement that the data bytes correspond to nucleic acid sequences, the claims have also been interpreted as having nucleic acids which can serve as both capture molecules as well as information storage device. A review of the specification fails to find where applicant has presented any description of nucleic acid acting as a computer-readable information storage medium, much less a description of same to the degree that it reasonably suggests that applicant was in possession of the invention at the time of filing.

Art Unit: 1634

16. It appears that applicant is attempting to satisfy the written description requirement of 35 USC 112, first paragraph, through obviousness. Obviousness, however, cannot be relied upon for satisfaction of the written description requirement. In support of this position, attention is directed to the decision in *University of California v. Eli Lilly and Co.* (Fed. Cir. 1997) 43 USPQ2d at 1405, citing *Lockwood v. American Airlines Inc.* (Fed. Cir. 1997) 41 USPQ2d at 1966:

Recently, we held that a description which renders obvious a claimed invention is not sufficient to satisfy the written description requirement of that invention.

17. For purposes of examination, claims 74, 75, and 78, directed to a detection and/or reading device, have been construed as encompassing a “disc” that can be of virtually any shape, that the registered data and capture assay may be on the same side, opposite sides, as well as allowing for the assay to be conducted internal to the “disc.” Additionally, the CD that the device is to read may well have additional coatings over the surface of the disc, which may include coatings of the disc, prior to the attachment of capture moieties, as well as coatings/precipitates subsequent to a binding reaction having taken place. Given this breadth of interpretation, the specification has been found to be essentially silent as to how a CD reader is to be manipulated to read both sides of a disc, and to be able to interpret the clusters of signal, when normal CD readers are interpreting pits found in grooves- which is where the registered binary data is stored.

18. While claim 74 has been amended so to recite that the laser beam is to “penetrate,” the claim does not identify the target or object of its penetration. It is noted that the same laser is to be reflected from lands and pits, however, it does not stand to reason that if it is reflected from the lands and pits, it is not penetrating same. The specification fails to provide an adequate

Art Unit: 1634

written description of where the laser is penetrating any material and also being reflected off of the lands and pits. If in fact the laser is penetrating a coating on the lands and pits, the angle of incidence could easily be such that internal reflection and/or refraction is being obtained. The specification is essentially silent as to how and with what the discs are to be coated and read in a reproducible manner.

19. Claims 73, 86, and 88, drawn to kits, are not adequately supported by the disclosure. It is noted with particularity that applicant is claiming compositions of matter. While the claims recite "reactants allowing the binding between a target molecule and its capture molecule," such speaks to how they are to perform, however, such language does not allow one to readily identify which compounds are encompassed by the claim and which are not.

20. In view of the scope of the amended claims, the limited disclosure provided, and the absence of convincing evidence to the contrary, claims 45, 50, 52-54, 60-66, 69-75, 78, 81-84, and 86-92 are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement.

21. Claims 45, 50, 52-54, 60-66, 69-75, 78, 81-84, and 86-92 are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the enablement requirement. The claim(s) contains subject matter, which was not described in the specification in such a way as to enable one skilled in the art to which it pertains, or with which it is most nearly connected, to make and/or use the invention.

22. As set forth in *Enzo Biochem Inc., v. Calgene, Inc.* (CAFC, 1999) 52 USPQ2d at 1135, bridging to 1136:

Art Unit: 1634

To be enabling, the specification of a patent must teach those skilled in the art how to make and use the full scope of the claimed invention without 'undue experimentation.' " *Genentech, Inc. v. Novo Nordisk, A/S*, 108 F.3d 1361, 1365, 42 USPQ2d 1001, 1004 (Fed. Cir. 1997) (quoting *In re Wright*, 999 F.2d 1557, 1561, 27 USPQ2d 1510, 1513 (Fed. Cir. 1993)). Whether claims are sufficiently enabled by a disclosure in a specification is determined as of the date that the patent application was first filed, see *Hybritech, Inc. v. Monoclonal Antibodies, Inc.*, 802 F.2d 1367, 1384, 231 USPQ 81, 94 (Fed. Cir. 1986). . . . We have held that a patent specification complies with the statute even if a "reasonable" amount of routine experimentation is required in order to practice a claimed invention, but that such experimentation must not be "undue." See, e.g., *Wands*, 858 F.2d at 736-37, 8 USPQ2d at 1404 ("Enablement is not precluded by the necessity for some experimentation However, experimentation needed to practice the invention must not be undue experimentation. The key word is 'undue,' not 'experimentation.' ") (footnotes, citations, and internal quotation marks omitted). In *In re Wands*, we set forth a number of factors which a court may consider in determining whether a disclosure would require undue experimentation. These factors were set forth as follows: (1) the quantity of experimentation necessary, (2) the amount of direction or guidance presented, (3) the presence or absence of working examples, (4) the nature of the invention, (5) the state of the prior art, (6) the relative skill of those in the art, (7) the predictability or unpredictability of the art, and (8) the breadth of the claims. *Id.* at 737, 8 USPQ2d at 1404. We have also noted that all of the factors need not be reviewed when determining whether a disclosure is enabling. See *Amgen, Inc. v. Chugai Pharm. Co., Ltd.*, 927 F.2d 1200, 1213, 18 USPQ2d 1016, 1027 (Fed. Cir. 1991) (noting that the *Wands* factors "are illustrative, not mandatory. What is relevant depends on the facts.").

The quantity of experimentation necessary

The amount of experimentation required is on the order of several man-years, with little, if any reasonable expectation of success.

The amount of direction or guidance presented

The amount of guidance provided is limited, and then not commensurate with the scope of the claims.

The presence or absence of working examples

Art Unit: 1634

A review of the disclosure finds the following examples:

Examples

Example 1: Detection of DNA on CD

Example 2: Detection of DNA on CD with laser detection

Example 3: Detection of protein on CD by light absorption

Example 4: Detection of protein Chips on CD with colorimetric labeling

Example 5: Detection of auto-immune antibodies on CD

Example 6: Magnetic detection of DNA or protein on CD

Example 7: Detection of several bacterial species and their genus by DNA microarrays present on the CDs

Bio-CD™ spotting

Example 8: Detection of gene expression on microarrays present on the CDs: example of HepatoChips

HepatoChips Design: Fifty-nine genes microarray

Example 9: Multiple sample analysis in the different molded chambers present on the same disc platform.

Example 10: Steps performed by the automate in the hybridization chamber.

Example 11: Olefinic oxidation

Example 12: Steps performed by the automate in the extraction, dilution, amplification and hybridization chamber.

Example 13: Target detection through the reflective layer of a CD with one laser illumination beam and two detectors

Example 14: Description of a fluorescent reading device

Example 15: Detection of protein upon the disc according to the invention with colorimetric labeling

Example 16 : Detection of auto-immune antibodies upon the disc according to the invention

The claimed invention has been amended so to require the presence of at least single stranded nucleic acids that are to serve as capture molecules, and that the CD or DVD comprises binary information that is to be read at the same time the hybridization results are. None of the examples provided disclose such a CD or DVD, much less a method of performing both aspects of the method. Similarly, none of the examples provide an adequate written description of any device capable of making such a CD or DVD or reading it, or capable of carrying out all phases of any related assay. Additionally, the examples provided fail to provide an adequate written description of the full genus of discs claimed. Furthermore, it is noted that none of the "capture molecules" are impervious to any and all forms of cleavage, an embodiment encompassed by the claims.

The state of the prior art

The state of the prior art is limited s it relates to combining both nucleic acid assays with a support that is to retain functional binary information

The predictability or unpredictability of the art

The claimed invention relates directly to the synthesis of arrays on a support that also comprises binary information that needs to be accessed and acted upon while the hybridization assay is taking place, and or the results are being collected and interpreted.

Art Unit: 1634

At column 40 of Jones (US Patent 5,858,671) the inherent obstacle in synthesizing oligonucleotide arrays is disclosed. As stated therein, "that even if the constituent enzymatic steps approach 100% completion, incompletely processed products can accumulate to significant levels. For example, during oligonucleotide synthesis of a 70-mer, requiring 69 couplings, a 99% coupling efficiency results in only 50% of the generated oligonucleotides being full length ($0.99^{69} = 0.50$).” In the present case, applicant is claiming a product that would be the result of an infinite number of couplings, not just 69 as described above.

Prior, as well as post-filing art teaches of numerous problems confronting those of ordinary skill in the art. These problems have not been addressed by the instant disclosure. Absent specific guidance as to how these issues are to be overcome, one of ordinary skill in the art would be forced to trial-and-error experimentation in an effort to overcome these known issues.

Zhang et al., *Bioinformatics*, Vol. 19, No. 1, 2003, page 14, states:

It is widely recognized that the hybridization process is prone to errors and that the future of DNA sequencing by hybridization is predicated on the ability to successfully cope with such errors. However, the occurrence of hybridization errors results in the computational difficulty of the reconstruction of DNA sequencing by hybridization. The reconstruction problem of DNA sequencing by hybridization with errors is a strongly NP-hard problem. So far the problem has not been solved well.

Chan (US Patent Application Publication US 2002/0119455 A1):

[0018] In practice, Probe Up methods have been used to generate sequences of about 100 base pairs. Imperfect hybridization has led to difficulties in generating adequate sequence. Error in hybridization is amplified many times. A 1% error rate reduces the maximum length that can be sequenced by at least 10%. Thus if 1% of 65,536 oligonucleotides gave false positive hybridization signals when hybridizing to a 200-mer DNA target, 75% of the scored "hybridizations" would be false (Bains, 1997). Sequence determination would be impossible in such an instance. The conclusion is that hybridization must be extremely effective in order to generate reasonable data. Furthermore, sequencing by hybridization also encounters problems when there are repeats in sequences that are one base less than the length of the probe. When such

sequences are present, multiple possible sequences are compatible with the hybridization data. (Emphasis added.)

As set forth in Carrico, (US Patent 5,200,313) the extent and specificity of hybridization is affected by the following principal conditions:

- The purity of the nucleic acid preparation.
- Base compositions of the probe - G-C base pairs will exhibit greater thermal stability than A-T or A-U base pairs. Thus, hybridizations involving higher G-C content will be stable at higher temperatures.
- Length of homologous base sequences- any short sequence of bases (e.g., less than 6 bases), has a high degree of probability of being present in many nucleic acids. Thus, little or no specificity can be attained in hybridizations involving such short sequences. From a practical standpoint, a homologous probe sequence will often be between 300 and 1000 nucleotides.
- Ionic strength- the rate of reannealing increases as the ionic strength of the incubation solution increases. Thermal stability of hybrids also increases.
- Incubation temperature- Optimal reannealing occurs at a temperature about 25 - 30 °C below the melting temperature for a given duplex. Incubation at temperatures significantly below the optimum allows less related base sequences to hybridize.
- Nucleic acid concentration and incubation time- Normally, to drive the reaction towards hybridization, one of the hybridizable sample nucleic acid or probe nucleic acid will be present in excess, usually 100 fold excess or greater.

Art Unit: 1634

- Denaturing reagents- the presence of hydrogen bond-disrupting agents, such as formaldehyde and urea, increases the stringency of hybridization.
- Incubation- the longer the incubation time, the more complete will be the hybridization.
- Volume exclusion agents- the presence of these agents, as exemplified by dextran and dextran sulfate, are thought to increase the effective concentrations of the hybridizing elements thereby increasing the rate of resulting hybridizations.
- Further, subjecting the resultant hybridization product to repeated washes or rinses in heated solutions will remove non-hybridized probe. The use of solutions of decreasing ionic strength, and increasing temperature, e.g., 0.1X SSC for 30 minutes at 65 °C, will, with increasing effectiveness, remove non-fully complementary hybridization products.

Barany et al. (US 2007/0042419 A1), at paragraph 0036 teaches in part:

For allele-specific oligonucleotide hybridization ("ASO"), the mutation must be known, hybridization and washing conditions must be known, cross-reactivity is difficult to prevent, closely-clustered sites due to interference of overlapping primers cannot undergo multiplex detection, and mutant DNA cannot be detected in less than 5% of background of normal DNA.

Choi et al. (US 2007/0042400 A1), at paragraph 0035, teach:

[0035] In conventional methods of preparing nucleic acid, polysaccharides such as starch often co-precipitate with nucleic acid. When polysaccharides co-precipitate with nucleic acid, it is difficult to manipulate nucleic acids by amplification methods, such as PCR, or by other detection methods, such as hybridization detection. Polysaccharides may also inhibit digestion with restriction endonucleases and other enzymatic manipulations.

It is noted that the claimed method fairly encompasses the use of genomic DNA, and the use of an enzyme substrate as a label.

Yasuno et al., (US 2007/0031829 A1), paragraph 0037, teach in part:

Art Unit: 1634

Certain oligonucleotides hybridize to polynucleotides having complementary sequences. Although DNA hybridization is sequence-specific, it is difficult to completely exclude hybridizations towards very similar nucleotide sequences.

Wang et al., (US 2007/0009954 A1), teach:

[0004] A number of methods have been developed to score SNPs, including allele-specific hybridization, electrophoretic DNA sequencing, single-nucleotide extension using labeled chain terminators, the "Invader" assay (Third Wave Technologies, Madison Wis.), mass spectrometry, the 5' nuclease assay (Taqman; see below), etc. All of these methods entail assays that are either difficult or expensive to develop, or difficult or expensive to perform.

Rowlen et al., (US 2006/0286570 A1) teach:

[0004] A variety of methods exist for detection of molecular recognition events. Detection of molecular recognition events such as DNA hybridization, antibody-antigen interactions, and protein-protein interactions becomes increasingly difficult as the number of recognition events to be detected decreases.

It is noted that the claimed method places no lower limit on the ability to accurately and reproducibly detect any binding between polymer and unit specific markers.

As evidenced above, the art is replete with known issues that directly impact the enablement of the claimed invention. A review of the instant disclosure fails to identify how these art-recognized issues are to be overcome such that the full scope of the invention can be practiced without the public having to resort to undue experimentation.

The situation at hand is analogous to that in *Genentech v. Novo Nordisk A/S* 42 USPQ2d 1001 in that the specification does not reasonably suggest that applicant had possession of the requisite starting materials, e.g., a CD or DVD with the requisite binary information and arrays of single stranded nucleic acids, and which are to be used in a hybridization reaction, and wherein said CD

Art Unit: 1634

or DVD has both binary information and nucleic acid hybridization products read by a reader.

As set forth in the decision of the Court:

“ ‘[T]o be enabling, the specification of a patent must teach those skilled in the art how to make and use the full scope of the claimed invention without undue experimentation.’ *In re Wright* 999 F.2d 1557, 1561, 27 USPQ2d 1510, 1513 (Fed. Cir. 1993); *see also Amgen Inc. v. Chugai Pharms. Co.*, 927 F. 2d 1200, 1212, 18 USPQ2d 1016, 1026 (Fed Cir. 1991); *In re Fisher*, 427 F. 2d 833, 166 USPQ 18, 24 (CCPA 1970) (‘[T]he scope of the claims must bear a reasonable correlation to the scope of enablement provided by the specification to persons of ordinary skill in the art.’).

“Patent protection is granted in return for an enabling disclosure of an invention, not for vague intimations of general ideas that may or may not be workable. *See Brenner v. Manson*, 383 U.S. 519, 536, 148 USPQ 689, 696 (1966) (stating, in context of the utility requirement, that ‘a patent is not a hunting license. It is not a reward for the search, but compensation for its successful conclusion.’) Tossing out the mere germ of an idea does not constitute enabling disclosure. While every aspect of a generic claim certainly need not have been carried out by an inventor, or exemplified in the specification, reasonable detail must be provided in order to enable members of the public to understand and carry out the invention.

“It is true . . . that a specification need not disclose what is well known in the art. *See, e.g., Hybritech, Inc. v. Monoclonal Antibodies, Inc.*, 802 F.2d 1367, 1385, 231 USPQ 81, 94 (Fed. Cir. 1986). However, that general, oft-repeated statement is merely a rule of supplementation, not a substitute for a basic enabling disclosure. It means that the omission of minor details does not cause a specification to fail to meet the enablement requirement. However, when there is no disclosure of any specific starting material or any of the conditions under which a process can be carried out, undue experimentation is required; there is a failure to meet the enablement requirement that cannot be rectified by asserting that all the disclosure related to the process is within the skill of the art. It is the specification, not the knowledge of one skilled in the art, that must supply the novel aspects of an invention in order to constitute adequate enablement. This specification provides only a starting point, a direction for further research. (Emphasis added)

In view of the breadth of scope claimed, the limited guidance provided, the unpredictable nature of the art to which the claimed invention is directed, and in the absence of convincing evidence

Art Unit: 1634

to the contrary, the claims 45, 50, 52-54, 60-66, 69-75, 78, 81-84, and 86-92 are deemed non-enabled by the disclosure.

Claim Rejections - 35 USC § 103

23. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

24. The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

25. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Art Unit: 1634

26. Claims 45, 50, 52-54, 60-66, 69, 71, 73-75, 78, 81-82, 84, 86, and 88-90 are rejected under 35 U.S.C. 103(a) as being unpatentable over US Patent 5,922,617 (Wang et al.).

27. Wang et al., teaches at length of using discs (applicant's CDs and DVDs) for conducting hybridization assays. As see in column 10, the disc comprises arrays of binding moieties are present. DNA is specifically identified. The discs are subject to reading by a disc-reading device, which can comprise a laser source, a beam splitter, which speaks to the presence of multiple detector units present. Also disclosed is the use of spinning of the disc in relating to a scanner to different sites along a given track and a linear motor that moves the scanner along a radial direction to scan over the entire disk. Column 6, second paragraph, specifically references the use of CDs.

28. Column 3 speaks directly to having functionalized groups on a surface of the disc, and that nucleic acids can be covalently bound to it through such functional groups, which are known in the art.

29. Column 14, penultimate paragraph, teaches explicitly of the incorporation of arrays, and that they may take a variety of forms. Column 14, last paragraph, teaches explicitly of the disc being divided into separate coded addressable sections, and that the beginning of a sector can comprise information about the given section.

30. Wang et al., column 13, discloses the disc further comprising microchannels.

31. Wang et al., in Figures 3A, 3B, and 5 depict multiple arrays of means for analysis of multiple samples. There are at least three arrays present in each figure. Such a showing meets a limitation of claim 90.

Art Unit: 1634

32. Wang et al., has not been found to recite specific densities of the arrays, nor the number of arrays one would prepare for a given sample, however, such limitations are not deemed to rise to the level of a patentable distinction but rather, constitute the end result of routine optimization. It is well settled that routine optimization is not patentable, even if it results in significant improvements over the prior art. In support of this position, attention is directed to the decision in *In re Aller, Lacey, and Hall*, 105 USPQ 233 (CCPA 1955):

Normally, it is to be expected that a change in temperature, or in concentration, or in both, would be an unpatentable modification. Under some circumstances, however, changes such as these may impart patentability to a process if the particular ranges claimed produce a new and unexpected result which is different in kind and not merely in degree from the results of the prior art. In re Dreyfus, 22 C.C.P.A. (Patents) 830, 73 F.2d 931, 24 USPQ 52; In re Waite et al., 35 C.C.P.A. (Patents) 1117, 168 F.2d 104, 77 USPQ 586. Such ranges are termed "critical" ranges, and the applicant has the burden of proving such criticality. In re Swenson et al., 30 C.C.P.A. (Patents) 809, 132 F.2d 1020, 56 USPQ 372; In re Scherl, 33 C.C.P.A. (Patents) 1193, 156 F.2d 72, 70 USPQ 204. However, even though applicant's modification results in great improvement and utility over the prior art, it may still not be patentable if the modification was within the capabilities of one skilled in the art. In re Sola, 22 C.C.P.A. (Patents) 1313, 77 F.2d 627, 25 USPQ 433; In re Normann et al., 32 C.C.P.A. (Patents) 1248, 150 F.2d 708, 66 USPQ 308; In re Irmischer, 32 C.C.P.A. (Patents) 1259, 150 F.2d 705, 66 USPQ 314. More particularly, where the general conditions of a claim are disclosed in the prior art, it is not inventive to discover the optimum or workable ranges by routine experimentation. In re Swain et al., 33 C.C.P.A. (Patents) 1250, 156 F.2d 239, 70 USPQ 412; Minnesota Mining and Mfg. Co. v. Coe, 69 App. D.C. 217, 99 F.2d 986, 38 USPQ 213; Allen et al. v. Coe, 77 App. D. C. 324, 135 F.2d 11, 57 USPQ 136. (Emphasis added)

33. In view of the detailed teachings provided by Wang et al., one of ordinary skill in the art at the time the invention was made would have been amply motivated to have adopted the method, disc, and devices of Wang et al., so to have a disc that comprises arrays of any desired density and multiplicity so that any target sequence of interest would be detected. Said detailed disclosure would have also instilled a reasonable expectation of success in developing said methods, discs, and related devices.

34. Claims 91 and 92 are rejected under 35 U.S.C. 103(a) as being unpatentable over US Patent 5,922,617 (Wang et al.) as applied to claims 45, 50, 52-54, 60-66, 69, 71, 73-75, 78, 81-82, 84, 86, and 88-90 are above, and further in view of 5,160,626 (Pemawansa et al.) or US Patent 5,800,992 (Fodor et al.).

35. See above for the basis of the rejection as it relates to the disclosure of Wang et al.

36. While Wang et al., teach broadly of bonding nucleic acids to a support through functional groups found on its surface, they do not specifically teach using aldehyde groups.

37. Pemawansa et al., claim 17, specifically recites linking nucleic acids to a support through aldehyde groups.

38. It would have been obvious to one of ordinary skill in the art at the time the invention was made to have modified the teachings of Wang et al., with that of Pemawansa et al., as Pemawansa et al., teach of a specific embodiment by which the nucleic acids can be immobilized to the surface of a support structure. In view of such explicit teachings, said ordinary artisan would have been both amply motivated and have had a most reasonable expectation of success.

39. For the above reasons, and in the absence of convincing evidence to the contrary, claim 57 is rejected under 35 U.S.C. 103(a) as being unpatentable over US Patent 5,922,617 (Wang et al.) as applied to claims 45, 50, 52-54, 60-66, 69, 71, 73-75, 78, 81-82, 84, 86, and 88-90 above, and further in view of 5,160,626 (Pemawansa et al.).

40. Fodor et al., column 46, teaches of binding DNA to acrylate groups found on the surface of a substrate. Such a showing meets a limitation of claims 91 and 92

Art Unit: 1634

41. It would have been obvious to one of ordinary skill in the art at the time the invention was made to have modified the teachings of Wang et al., with that of Fodor et al., as Fodor et al., teach of a specific embodiment by which the nucleic acids can be immobilized to the surface of a support structure. In view of such explicit teachings, said ordinary artisan would have been both amply motivated and have had a most reasonable expectation of success.

42. For the above reasons, and in the absence of convincing evidence to the contrary, claim 58 is rejected under 35 U.S.C. 103(a) as being unpatentable over Wang et al., as applied to claims 45, 50, 52-54, 60-66, 69, 71, 73-75, 78, 81-82, 84, 86, and 88-90 above, and further in view of US Patent 5,800,992 (Fodor et al.).

43. Claim 70 is rejected under 35 U.S.C. 103(a) as being unpatentable over US Patent 5,922,617 (Wang et al.) as applied to claims 45, 50, 52-54, 60-66, 69, 71, 73-75, 78, 81-82, 84, 86, and 88-90 above, and further in view of US Patent 4,542,102 (Dattagupta et al.).

44. See above for the basis of the rejection as it relates to the disclosure of Wang et al.

45. While Wang et al., teach broadly of bonding nucleic acids to a support through functional groups found on its surface, they do not specifically teach linking nucleic acids to the support via photoactivatable groups.

46. Dattagupta et al., teaches at length various methods by which nucleic acids can be coupled to a support through the action of photoactivatable groups.

47. It would have been obvious to one of ordinary skill in the art at the time the invention was made to have incorporated the use of photoactivatable groups in the disc of Wang et al., as

Art Unit: 1634

such would have afforded the ordinary artisan a highly efficient and effective means by which nucleic acids can be coupled to a given support.

48. In view of the detailed teachings provided by the prior art of record, said ordinary artisan would have also had a most reasonable expectation of success. Therefore, and in the absence of convincing evidence to the contrary, claim 70 is rejected under 35 U.S.C. 103(a) as being unpatentable over US Patent 5,922,617 (Wang et al.) as applied to claims 45, 50, 52-54, 60-66, 69, 71, 73-75, 78, 81-82, 84, 86, and 88-90 above, and further in view of US Patent 4,542,102 (Dattagupta et al.).

49. Claims 72 and 87 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wang et al., as applied to claims 45, 50, 52-54, 60-66, 69, 71, 73-75, 78, 81-82, 84, 86, and 88-90 above, and further in view of US Patent 5,556,748 (Douglas).

50. See above for the basis of the rejection as it relates to the disclosure of Wang et al.

51. While Wang et al., teach broadly of bonding nucleic acids to a support through functional groups found on its surface, they do not specifically teach using a masking group such as albumin.

52. Douglas, column 3, bridging to column 4, teaches explicitly of binding DNA to a plastic surface that has functional groups on it, and that the areas surrounding the bound nucleic acids can be coated with protective materials such as albumin. This teaching meets a limitation of claims 72 and 87.

53. It would have been obvious to one of ordinary skill in the art at the time the invention was made to have included the use of albumin as a protective layer on the discs of Wang et al., as

Art Unit: 1634

such would have minimized the non-specific binding of reactants with the disc's surface, thereby resulting in more reproducible and accurate assays.

54. In view of the detailed disclosures, said ordinary artisan would have also had a most treasonable expectation of success.

55. For the above reasons, and in the absence of convincing evidence to the contrary, claims 72 and 87 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wang et al., as applied to claims 45, 50, 52-54, 60-66, 69, 71, 73-75, 78, 81-82, 84, 86, and 88-90 above, and further in view of US Patent 5,556,748 (Douglas).

Response to argument

56. Applicant has submitted a declaration under 37 CFR 1.131 in an attempt to remove the Wang reference (US Patent 5,922,617) as available prior art, and thereby render moot the rejections under 35 USC 103(a).

57. The declaration has been fully considered and has not been found persuasive. It is noted that the declaration contains statements attributed to "lead inventor, Jose Remacle." It is further noted that the declaration contains signatures of two of the three named co-inventors. The declaration has not been found to contain the signature of Yves Houbion. Further, no statement has been found or attributed to the works of either co-inventor Isabelle Alexandre or Yves Houbion.

58. Assuming *arguendo*, that the declaration did contain signatures from all three co-inventors, the declaration does not reasonably suggest that applicant had possession of the invention at a date prior to the effective filing date of US Patent 5,922,617 (Wang et al.). It is

Art Unit: 1634

noted that the Exhibits provided are that of a proposal to study the “minimal technical feasibility of the 3 essential steps for the development of an integrated system for the detection of DNA probes on a compact disc using detection of a laser beam reflection as used in the reading of actual CD. These three steps are: addressing the probes on the disc, the formation of a reaction product and finally the reading of the obtained signal by reflection of a laser beam.”

59. A review of the declaration fails to find where the “3 steps” even suggest the aspects of:
- a. Covalent linkages;
 - b. A reading device;
 - c. A handling device;
 - d. A DVD;
 - e. Linking of nucleic acid probes, via covalent bonds, to the CD and/or DVD via a polymeric layer, wherein polymeric layer is selected from the group consisting of aldehyde groups, acrylate groups or an oxidized polymeric layer;
 - f. The presence of binary data on the discs much less its location;
 - g. The sidedness of the discs in that binary data is on one side while the probe arrays are on another;
 - h. The number of arrays present on the CD;
 - i. The presence of microchannels and valves to fluidly connect chambers;
 - j. The absence of a “cleavable spacer;”
 - k. The nature of the registered data;
 - l. The presence of libraries of molecules; and
 - m. The presence of a second reading device that comprises a photodiode.

Art Unit: 1634

60. In short, the declaration lacks the specificity to successfully demonstrate that applicant had possession of the invention at a date prior to that of the Wang et al., reference. Accordingly, and in the absence of convincing evidence to the contrary, the Wang et al., reference remains available prior art and the rejection of claims under 35 USC 103(a) is maintained against previously-pending claims and has also been applied against newly-added claims 90-92.

61. In an attempt to show evidence of sufficiency of the disclosure and therein have the rejection of claims under 35 USC 112, first paragraph, be withdrawn, a declaration under 37 CFR 1.132, signed by Joel Demarteau on 19 February 2007, was provided with the response of 20 February 2007. The declaration under 37 CFR 1.132 filed 20 February 2007 is insufficient to overcome the rejection of claims 45, 50, 52-54, 60-66, 69-75, 78, 81-84, and 86-92 based upon 35 USC 112, first paragraph, as set forth in the last Office action because: The declaration makes assertions as to what one of skill in the art would have known or understood without establishing what the level of skill is. While declarant provides statements as to his familiarity with the field of the invention, the declaration has not been found to contain statement that declarant considers self to be one of skill in the art.

62. At page 4 (paragraph 9) of the declaration statements are made as to what one of skill in the art could do in terms of manufacturing CDs. This statement is conclusory in nature and void of any factual underpinning.

63. At page 4, bridging to page 5, of the Declaration, declarant provides analysis of Figures 11, 12, 13, and 14, asserting, *inter alia*, that these Figures "provide electronic schematics for both detectors." This argument has not been found persuasive, as the Figures identified do not

Art Unit: 1634

provide any schematic for any of the complex electronic assemblages used in a detection device. Rather, the figures provide general path that light is to take going toward and from the CD/DVD. While electronic elements are present in the figures, they are represented by a rectangular box. See element 53 in Fig. 11, and element 61 in Figs. 12, 13 and 14. Page 38 of the disclosure states that element 53 is a "detection device." Page 39 asserts that element 61 is of a CD reader.

64. The "second reader," element 56 of Fig. 11, (page 38 of disclosure) is shown as something of a parallelogram. A review of the cited passages and of the disclosure in general, fails to locate where applicant has provided a detailed teaching of the complex electrical connections needed and required for electrical detection and analysis.

65. Attention is directed to MPEP 2164.06.

II. EXAMPLE OF UNREASONABLE EXPERIMENTATION

In *In re Ghiron*, 442 F.2d 985, 991-92, 169 USPQ 723, 727-28 (CCPA 1971), functional "block diagrams" were insufficient to enable a person skilled in the art to practice the claimed invention with only a reasonable degree of experimentation because the claimed invention required a "modification to prior art overlap computers," and because "many of the components which appellants illustrate as rectangles in their drawing necessarily are themselves complex assemblages It is common knowledge that many months or years elapse from the announcement of a new computer by a manufacturer before the first prototype is available. This does not bespeak of a routine operation but of extensive experimentation and development work. . . ."

For the above reasons, and in the absence of convincing evidence to the contrary, the declaration has not been found persuasive towards the withdrawal of the rejection of claims under 35 USC 112, first paragraph.

Conclusion

66. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

67. A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than **SIX MONTHS** from the date of this final action.

68. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Bradley L. Sisson whose telephone number is (571) 272-0751. The examiner can normally be reached on 6:30 a.m. to 5 p.m., Monday through Thursday.

69. If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Ram Shukla can be reached on (571) 272-0735. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
